Burrus has ranked various products, noting their potential responsiveness to fungicide. Should a blind application of fungicide be required, this chart should allow the grower to apply fungicide to those products more likely to provide a return (high probability ranking). However, Burrus reminds growers that a fungicide return on investment is best assured by scouting fields for economically significant levels of disease (wide spread lesions within proximity of or above the ear leaf). Repeatedly applying fungicides from the same class can increase the likelihood of resistance development and deregulation.
