

# POWERSHIELD® CORN SEED TREATMENT

## FUNGICIDES

Six unique modes of action are combined to provide multiple layers of protection for all major seed diseases, including Pythium, Rhizoctonia and Fusarium.

## INSECTICIDES

Two unique modes of action deliver multiple benefits: consistent protection over variable emergence environments, pest resistance management and best in class black cutworm protection.

## NEMATICIDE

PowerShield® contains a biological nematicide that provides economical activity on 11 types of corn nematodes: dagger, lance, needle, pin, ring, root knot, root lesion, spiral, sting and stubby root.

## 2022 POWERSHIELD® CONTROL

PowerShield for corn contains 6 active fungicide ingredients, 2 ingredients for insect control plus a nematicide.

PEST	CONTROL
Fusarium	Yes
Rhizoctonia	Yes
Pythium	Yes
Anthraxnose	Yes

# POWERSHIELD® SOYBEAN SEED TREATMENTS

## FUNGICIDES

Four unique modes of action provide layers of activity to protect your soybeans from Pythium, Phomopsis, Fusarium, Phytophthora and Rhizoctonia for a strong early start.

## INSECTICIDE

A broad-spectrum seed-applied insecticide provides multiple benefits: improves plant health, reduces early-season soybean aphid populations and reduces early-season damage from seed corn maggots and bean leaf beetle.

## PS SDS

PowerShield SDS contains an additional active ingredient that protects against the fungi that causes SDS and has early-season suppression of soybean cyst nematode. This is especially important when planting soybeans early in the season with greater cool weather risk.
